Welcome Messages

Message from the ICPR2006 General Co-Chairs

It is our pleasure to organize the 18th International Conference on Pattern Recognition (ICPR) 2006 in Hong Kong. Following the practice of the ICPR, a multi-track conference is arranged. We have five tracks, namely, “Computer Vision and Image Analysis”, “Pattern Recognition and Basic Technologies”, “Signal, Speech and Image Processing”, “Systems, Robotics and Applications (with associated theme: Biometrics)” and “Cognitive Approaches & Soft Computing”. We received a record-breaking number of full paper submissions, 2029 papers from 48 countries. A total of 311 papers are selected for oral presentation while 857 are selected for poster presentation.

We are also very honored to have Prof. Anil K. Jain from Michigan State University, USA, Prof. Ru-Wei Dai from the Academia Sinica, China and Prof. Lawrence O. Hall from University of South Florida, USA to deliver the Conference plenary speeches. We have also invited the following ten top researchers to deliver invited talks for the five Tracks: Prof. Prabir Bhattacharya from Concordia University, Canada, Prof. Hans Burkhardt from Albert-Ludwigs-University, Germany, Prof. Virginio Cantoni from University of Pavia, Italy, Prof. George Djorgovski from Caltech, USA, Prof. Olivier Faugeras from INRIA, France, Prof. Richard Hartley from Australian National University, Australia, Prof. Josef Kittler from University of Surrey, United Kingdom, Prof. Alex Pentland from MIT Media Lab, USA, Prof. José Carlos Príncipe from University of Florida, USA and Prof. Alexander Waibel from Carnegie Mellon University, USA.

We are truly indebted to the Hong Kong Baptist University, especially the staff of the Department of Computer Science, for their strong support of ICPR 2006.

It is really the Track Chairs and the Associated Theme Coordinators who should be credited for the high quality technical program that makes ICPR the premier conference in pattern recognition. The rigorous paper peer review exercise was led by Prof. Josef Bigun, Prof. Andreas Dengel, Prof. Robert Haralick, Dr. Tin Kam Ho, Prof. Horace Ip, Prof. Seong-Whan Lee, Prof. Brian Lovell, Prof. Long Quan, Dr. Nalini Ratha, Dr. Gabriella Sanniti di Baja, Prof. Kazuhiko Yamamoto and Prof. Pong C. Yuen. They should be applauded for their tireless effort and dedication. They sacrificed their weekends, vacation time and even early morning hours trying to get the numerous, tedious problems resolved. We

also would like to thank all Program Committee members, reviewers, contributing authors and conference participants who make this conference possible.

Our special thanks go to Prof. Hong Yan for the technical program scheduling, Dr. William Cheung for the submission system, Dr. C.H. Li for the overall conference organization, Dr. Xiaowen Chu for the publication of the proceedings, Dr. Nanning Zheng and Dr. James Kwok for the workshop organization, Dr. Chao Huan Hou and Dr. D.Y. Yeung for the tutorial organization, Prof. Irwin King for the poster session organization, Dr. Yiu-Ming Cheung and Dr. Man-Wai Mak for publicity activity, Dr. Victor Cheng for registration arrangement, Dr. Kelvin Wong, Dr. Kenneth Lam and China Travel Conference and Event Management for local arrangement.

Finally, we do hope that you enjoy the conference and your stay in Hong Kong.

Message from the President of IAPR

It is my great pleasure to welcome you to the 18th International Conference on Pattern Recognition (ICPR). This conference is the main event of the International Association for Pattern Recognition (IAPR) held biennially in different parts of the world. This time Hong Kong, Asia's World City at the southeastern tip of China is hosting this big event. It offers a great opportunity to hear about and to discuss the newest results in the extremely fast developing field of pattern recognition.

Let me invite you to take advantage of the fact that most of the active researchers and scientists come together at the ICPR. It is a great opportunity to refresh contacts, discuss open research issues and to create new friendships across countries and continents.

Ten years ago I was responsible for organizing ICPR 1996 in Vienna. ICPR is still growing, the number of submitted papers has reached a new record of more than 2000! This is a positive sign for our field and for the IAPR as an international association but it brings also some new challenges. A huge number of papers need to be reviewed in a very short period of time. It is not easy to maintain a high level of quality across the many reviewers from different scientific fields and different scientific cultures reading and commenting around 15 papers each. I would like to take this opportunity to thank the many reviewers for giving the authors a valuable feedback on their contributions and allowing them to improve their work. IAPR has to work hard to continuously improve the quality of the scientific communication while faced with still growing numbers.

When I was elected president of the IAPR I highlighted two concerns that I consider important for the future of the IAPR: 1. To make scientific and professional quality visible; and 2. To develop a well-structured curriculum of pattern recognition.

These two issues are long term issues and will require further efforts in the future. Prizes and awards are excellent possibilities to serve certain aspects of the first issue. The traditional K.S. Fu Prize will be given to Prof. Josef Kittler for contributions in the rigorous and systematic application of probability theory for developing new approaches and methodologies in pattern recognition and image processing.

But I am glad to announce the new J. K. Aggarwal Prize. The first prize will be awarded during this ICPR. The recipient is a young scientist, who has brought a

substantial contribution to a field that is relevant to the IAPR community and whose research work has had a major impact on the field.

The second issue has been dealt with by the educational committee. To create an educational backbone as a base for future research in pattern recognition has been started but will need further efforts in the future. If you are interested in and willing to contribute to this issue or any other topics addressed by the many standing and technical committees of the IAPR you are cordially invited to participate in these activities. IAPR lives through the activities of its members!

Two years of presidency of IAPR has been a great experience for me. I would like to take this opportunity to express my appreciation to all our colleagues who dedicated so much effort in the organization of this conference. Furthermore I would like to thank my fellow executive committee members, members of the governing board, chairs of various standing, technical and ad-hoc committees for their leadership and dedication to IAPR.

Plenary Speeches

On Context, Modelling, Dimensionality and Small Sample Size in Pattern Recognition

Josef Kittler

*Centre for Vision, Speech and Signal Processing, University of Surrey
Hall B/C, 09:00~10:00, Monday, 21/08/06*

Abstract: Some of the key issues that have exercised the pattern recognition research community over the last three or four decades will be discussed from a personal historical perspective. These will include design of decision rules, dimensionality of representation, size of the design sample set, and the role of context. The questions of how much progress has been made and what is missing will be considered, with examples from both categories.

About the speaker: Josef Kittler has been a Research Assistant in the Engineering Department of Cambridge University (1973--75), SERC Research Fellow at the University of Southampton (1975-77), Royal Society European Research Fellow, Ecole Nationale Supérieure des Telecommunications, Paris (1977--78), IBM Research Fellow, Balliol College, Oxford (1978--80), Principal Research Associate, SERC Rutherford Appleton Laboratory (1980--84) and Principal Scientific Officer, SERC Rutherford Appleton Laboratory (1985).

He also worked as the SERC Coordinator for Pattern Analysis (1982), and was Rutherford Research Fellow in Oxford University, Dept. Engineering Science (1985). He joined the Department of Electrical Engineering of Surrey University in 1986 as a Reader in Information Technology, and became Professor of Machine Intelligence in 1991. He is the Course Organiser for the MSc Course in Signal Processing and Machine Intelligence. He teaches Machine Intelligence, and Pattern Recognition.

He has worked on various theoretical aspects of Pattern Recognition and Machine Vision. He gained experience in many applications including Automatic Inspection, Remote Sensing, Robotics, Speech recognition, Character Recognition and Document Processing. His current research interests include Pattern Recognition, Neural Networks, Image Processing and Computer Vision. He has co-authored a book with the title *Pattern Recognition: A Statistical Approach* published by Prentice-Hall. He has published more than 500 papers.

He served as a member of the Editorial Board of IEEE Transactions on Pattern Analysis and Machine Intelligence during 1982-85. Currently serves on the Editorial Boards of Image and Vision Computing, Pattern Recognition Letters, Pattern Recognition and Artificial Intelligence, Pattern Analysis and Applications. He served on the Governing Board of the International Association for Pattern Recognition (IAPR) as one of the two

British representatives during the period 1982-2005. He was the President of the IAPR during 1994-1996. Currently he chairs the IAPR Constitution and Bylaws Committee.

Fingerprints: Proving Ground for Pattern Recognition

Anil K. Jain

*Department of Computer Science & Engineering, Michigan State University
Hall B/C, 09:00~10:00, Tuesday, 22/08/06*

Abstract: The smoothly flowing pattern formed by alternating crests (ridges) and troughs (valleys) on each finger tip is referred to as a fingerprint. A fingerprint is believed to be unique to each person (and each finger). Fingerprints of even identical twins are different and it has been claimed that the fingerprint of an individual does not change throughout the lifetime, unless there is a significant injury to the finger that creates a permanent scar. The term fingerprint is now synonymous with any uniqueness or inherent characteristic, e.g., "DNA fingerprinting". Galton was so fascinated by these marks on the human body that he remarked in his article in Nature in 1888 that "*Perhaps the most beautiful and characteristics of all superficial marks are the small furrows with intervening ridges and pores that are disposed in a singularly complex yet even order on the under surfaces of the hands and the feet*". It is the early scientific work of Faulds, Galton and Henry that forms the basis of fingerprint pattern recognition systems, called AFIS (Automatic Fingerprint Identification System) that are being used by law enforcement agencies world wide for over 40 years. As an example, the IAFIS (Integrated AFIS) system used by the Federal Bureau of Investigation (FBI) has a database consisting of approximately 500 million fingerprint images of 50 million individuals (one print/finger) and performs about 50,000 searches (queries) per day with an impressive accuracy and response time. Fingerprint identification is perhaps the most mainstream application and the largest deployment of pattern recognition technology.

The requirements of reliable and highly accurate personal identification in a number of government and commercial applications (e.g., international border crossings, e-passports, access control to buildings, laptops and mobile phones, financial transactions) have served as an impetus for a tremendous growth in fingerprint recognition technology. This, in turn, has led to new developments in fingerprint sensing and robust and efficient feature extractors and matchers. About 45% of the global biometric recognition market, whose revenues are projected to grow from about US \$2.1B in 2006 to US \$5.7B in 2010, is expected to be dominated by fingerprints. This growth in the use of fingerprint technology driven largely by government programs and private-sector initiatives will affect a large portion of population worldwide (e.g., the US-VISIT program). This, in turn, will place some unique requirements and constraints on the design of fingerprint pattern recognition systems pertaining to sensing, ergonomics, recognition accuracy, response time and throughput. This talk will provide a brief history of fingerprints, design of a fingerprint pattern recognition system, emerging applications and some recent developments and challenges. We believe that research in designing fingerprint

recognition systems will push the frontiers of pattern recognition and have numerous societal benefits.

Chinese Character Recognition: Status and Prospects in Research and Applications

Ru-Wei Dai (Ju Wei Tai)

Institute of Automation, Chinese Academy of Sciences, China

Hall B/C, 09:00~10:00, Wednesday, 23/08/06

Abstract: Computer recognition of Chinese characters was considered an extremely difficult problem due to the large set of characters, complicated structures, similarity between characters, and variability of fonts and writing styles. Since the early attempt of Casey and Nagy in 1960s at IBM, a large number of efforts have been made by worldwide researchers to attack this problem. Particularly, many effective methods were proposed in 1980s and 1990s. The 1990s witnessed a rapid increase of successful applications to various areas, such as postal mail sorting, business card recognition, bank check and transaction forms processing, and recently, in digital libraries and mobile phones. However, higher recognition performance is continuously needed to improve the existing applications and to exploit new applications.

The contents of this talk include four major parts: the nature of Chinese character recognition problem, a historical review of research works, current status of methods and

applications, and prospects. We will emphasize on the methods that make applications successful, including those for pre-processing, feature extraction, classification, and contextual processing. As for classification, we will compare statistical, structural (syntactic), and hybrid statistical-structural (semantic-syntactic) methods, and will pay special attention to strategies for accelerating large character set recognition and learning from large amount of sample data, as well as the multi-classifier (meta-synthesis) approach for improving the recognition accuracy. We will show the remaining problems and discuss the possibilities to solve them. Last, we will show a higher performance recognition system to demonstrate the current technology.

What are Classifier Ensembles Good for Anyway and How Would You Know?

Lawrence O. Hall

*Department of Computer Science and Engineering, University of South Florida
Hall B/C, 09:00~10:00, Thursday, 24/08/06*

Abstract: Ensembles of classifiers can result in an overall classifier that is more accurate than a single classifier. However, they are more costly to create. In this talk we will argue that an ensemble can be useful in building a model of very large data sets

even if members of the ensemble see only a nonstratified portion of the data. Several examples will be given. Further, a 57 data set statistical comparison of some rapid, and not so rapid, ensemble classifier construction approaches will be discussed.

Computers in the Human Interaction Loop (CHIL) or: How to Overcome Techno-Clutter

Alexander Waibel

*School of Computer Science, Carnegie Mellon University and University of Karlsruhe
Room 401, 10:30~11:10, Tuesday, 22/08/06*

Abstract: After building computers that paid no intention to communicating with humans, the computer science community has devoted significant effort over the years to more sophisticated interfaces that put the "human in the loop" of computers. These interfaces have improved usability by providing more appealing output (graphics, animations), more easy to use input methods (mouse, pointing, clicking, dragging) and more natural interaction modes (speech, vision, gesture, etc.). Yet productivity gains attributed to more natural interfaces has been somewhat disappointing, as the machine still operates in a largely passive mode, requiring considerable attention of the user to the artifacts of technology rather than to the tasks at hand or the interaction with other humans.

In this talk, we present an alternate way: putting Computers in the Loop of Human Interaction (CHIL), rather than the other way round. CHIL provides a paradigm by which computers provide assistance implicitly and proactively, while causing minimal interference. A family of "CHIL" computing services can be envisioned, where humans interact with humans and computers hover in the background providing assistance wherever needed. Providing such services in real life situations, however, brings formidable technical challenges. Computers must be made aware of the activities, locations, interactions, and cognitive states of the humans that they are to serve and they must become socially responsive. Services must be delivered and provided in a private, secure, and socially acceptable manner.

The European funded project CHIL attempts to address all these challenges. It includes work on a service layer, which builds prototypical CHIL services and evaluates their usefulness and usability. The Service layer, in turn, builds on a technology layer, which provides a complete description of human activities and interactions that allow it to derive and infer needs, i.e., the WHO, WHERE, HOW, TO WHOM, WHY, WHEN of human interaction and engagement. To build acoustic and visual recognition technologies as descriptors, we have set up several meeting and lecture rooms equipped

with a myriad of acoustic and visual sensors. Based on these sensors, large databases of real human office data have been collected, and large scale technology development efforts are underway. Processing real, unscripted interaction data poses considerable additional problems related to robustness, as variability due to noise, interference, occlusion, illumination, and many more, compound the processing challenges.

To make rapid progress, therefore, several international, benchmarking campaigns have initiated, where each of the contributing technologies is evaluated and compared, leading to considerable progress in the field. In this talk, I will discuss the technologies and present several prototypical services under development.

About the speaker: Alex Waibel is a Professor of Computer Science at Carnegie Mellon University, Pittsburgh and at the University of Karlsruhe (Germany). He directs InterACT, the international Center for Advanced Communication Technologies at both Universities with research emphasis in speech recognition, language processing, speech translation, multimodal and perceptual user interfaces. At Carnegie Mellon, he also serves as Associate Director of the the Language Technologies Institute and holds joint appointments in the Human Computer Interaction Institute and the Computer Science Department.

Image Representation and Retrieval Using Support Vector Machine and Fuzzy C-means Clustering Based Semantical Spaces

Prabir Bhattacharya

Concordia Institute for Information Systems Engineering, Concordia University

Room 401, 13:30~14:10, Tuesday, 22/08/06

Abstract: This talk presents a learning based framework for content-based image retrieval to bridge the gap between low-level image features and high-level semantic information presented in the images on semantically organized collections. Both supervised (probabilistic multi-class support vector machine) and unsupervised (fuzzy c-means clustering) learning based techniques are investigated to associate global MPEG-7 based color and edge features with their high-level semantical and/or visual categories. It represents images in a successive semantic level of information abstraction based on confidence or membership scores obtained from the learning algorithms. A fusion-based similarity matching function is employed on these new image representations to rank and retrieve most similar images compared to a query image. Experimental results on a generic image database with manually assigned semantic categories and on a medical image database with different modalities and examined body parts demonstrate the effectiveness of the proposed approach compared to the commonly used Euclidean distance measure on MPEG-7 based descriptors.

About the speaker: Prabir Bhattacharya is currently a full Professor at the Concordia Institute for Information Systems Engineering, Concordia University, Montreal, Canada where he holds a Canada Research Chair, Tier 1. During 1986-99, he served at the Department of Computer Science and Engineering, University of Nebraska-Lincoln, USA. Remaining Problems in Multiview Geometry

Richard Hartley

Department of Systems Engineering, Australian National University

Hall B/C, 15:40~16:20, Tuesday, 22/08/06

Abstract: The development of Multiple-view geometry in the last decade and a half brought with it the mathematical formalization of the subject of structure and motion, and many of its concepts are now part of the every-day language of computer vision -

homography, fundamental matrix, camera matrix. The practical advances that this has brought have been impressive also. Automatic real-time algorithms for structure and motion have been demonstrated. Nevertheless, some problems in structure and motion have not found a satisfactory solution. These include reconstruction from many view of many points, and self calibration. Algorithms have remained somewhat heuristic.

Optimization methods that have been used to solve such problems have been largely restricted to local least-squares methods (notably the Levenberg-Marquardt algorithm). Recent discovery of new methods of optimization have opened the way to finding guaranteed optimal techniques for finding the global best solution.

This talk will survey the history of Multiple-view geometry, identify some of the remaining problems, and suggest possible ways in which some of these problems may be solved.

About the speaker: Professor Richard Hartley is a member of the Vision Science, Technology and Applications Program in National ICT Australia; from 2003 until 2006 he was the leader of this research group. This program seeks to apply method of Computer Vision and Sensor Technology in a range of real-world problems, ranging from motor-vehicle safety to improved methods of health care. To this end, the research program supports research projects in Intelligent Vehicles, Surveillance, Mobile Robotics and Medical Imaging.

In 2001, Professor Hartley returned from the USA to a position in the Department of Information Engineering at the Australian National University. Before that, he worked at the General Electric Research and Development Center in Schenectady New York from 1985 to 2001. During the period 1985-1988, he was involved in the design and implementation of Computer-Aided Design tools for electronic design and created a very successful design system called the Parsifal Silicon Compiler. In 1991 he was awarded GE's Dushman Award for this work.

He began work in Image Understanding and Scene Reconstruction for GE's Simulation and Control Systems Division. This division built large-scale flight-simulators. Dr. Hartley's projects in this area were in the construction of terrain models and texture mosaics from aerial and satellite imagery.

In 1991, he began an extended research effort in the area of applying geometric techniques to the analysis of video. This far-reaching research led to fundamental advances in machine-understanding of video, and opened up one of the most popular areas of Computer Vision research in the 1990s. The most visible outcome of this research was in automating the creation of special effects in the film entertainment industry. In 2000, he co-authored a book "Multiple View Geometry in Computer Vision" for Cambridge University Press, summarizing the previous decade's research in this area. This has become one of the most popular research reference texts in Computer Vision.

He has authored over 100 papers in Photogrammetry, Computer Vision, Geometric Topology, Geometric Voting Theory, Computational Geometry and Computer-Aided Design, and holds 34 US patents.

Invariants for 2D and 3D Pattern Recognition Problems - New Results for a Classical Problem

Hans Burkhardt

Institute for Computer Science, Albert-Ludwigs University

Hall A, 15:40~16:20, Wednesday, 23/08/06

Abstract: In many pattern recognition problems images have to be classified independent of their current position and orientation, which is just a nuisance parameter. Instead of comparing a measured pattern in all possible locations against the prototypes it is much more attractive to extract position-invariant and intrinsic features and to

classify the objects in the feature space. Mathematically speaking, patterns form an equivalence class with respect to a geometric coordinate transform describing motion. Invariant transforms are able to map such equivalence classes into one point of an appropriate feature space.

The talk will describe new results for this classical problem and outlines general principles for the extraction of invariant features from images (Haar integrals, Lie-Theory, Normalization techniques). The nonlinear transforms are able to map the object space of image representation into a canonical frame with invariants and geometrical parameters. Beside the mathematical definition the talk will concentrate on characterizing the properties of the nonlinear mappings with respect to completeness and possible ambiguities, disturbance behavior and computational complexity. We especially investigated Haar integrals for the extraction of invariants based on monomial and relational kernel functions.

Examples and applications will be given for problems in 2D and 3D, namely applications in content-based image and object retrieval and classification tasks in 2D and 3D (classification and retrieval of biological objects and structures).

Challenges for Data Mining in Distributed Sensor Networks

Virginio Cantoni

Computer and Systems Engineering Department, University of Pavia

Room 404/5, 10:30~11:10, Thursday, 24/08/06

Abstract: The way of collecting sensor data will face a revolution when the newly developing technology of distributed sensor networks becomes fully functional and widely available. Smart sensors will acquire full interconnection capabilities with similar devices, so that run-time data aggregation, parallel computing, and distributed hypothesis formation will become reality with off-the-shelf components and sensor boards. This revolution started around ten years ago, and now hardware and network are converging on the first convincing solutions. Exploring and exploiting this paradigm are a renovated challenge for the pattern recognition and data mining community. This paper attempts a survey on state-of-the-art of wireless sensor technology, with an eye on data-related problems and technological limits. Although the possibilities seem promising, the today limited computational resources of individual nodes hamper the elaboration of data with recent, computationally-intensive algorithms. New software paradigms must be developed, both creating new techniques or adapting, for network computing, old algorithms of earlier ages of computing.

He is Fellow of the IAPR (International Association for Pattern Recognition) since 1994 and Fellow of IEEE (Institute of Electrical and Electronic Engineers) since 1997.

Information Fusion in Pattern Recognition Systems with Application to Biometrics

Josef Kittler

School of Electronics and Physical Sciences, University of Surrey

Room 404/5, 13:30~14:10, Thursday, 24/08/06

Abstract: By definition, any pattern recognition system fuses measurement information to reach a decision about the identity of an object or phenomena to be recognised. The classical statement of the problem of pattern recognition system design, which has been addressed in this form for decades, is as follows: how can the available measurement information be combined in order to find the best possible separation of pattern classes. However, this paper is concerned with information fusion at somewhat different level. It is well recognised that the process of classifier design is detrimentally affected by serious lack of knowledge of the underlying probability distributions of pattern classes. This is manifest in structural and estimation errors which affect the accuracy of the models that are inferred as part of the classifier design process. A relatively recent body of evidence suggests that Bayesian estimation methods can provide a measure of protection against severe modelling errors and their use results in better pattern recognition system designs, with significantly boosted performance. The essence of Bayesian estimation is to integrate over the probability distributions of the system design parameters. In practice, this integration can be accomplished by building and combining multiple classifiers. In the paper the three basic paradigms of multiple classifier fusion will be introduced. The focus of the discussion will then be on multimodal fusion, where sensory information from multiple sensors is combined to accumulate complimentary sources of information about the objects to be classified. The problem of intramodal fusion will then be considered. The merit of multiple classifier fusion will be illustrated on the problem of personal identity authentication using multiple biometric modalities.

Sessions are listed chronologically, and Oral Sessions are followed by Poster Sessions. Oral sessions of Tracks I to V are ordered according to track numbers and assigned to Hall B/C, Hall A, Room 401, Room 404/405 and Room 406/407 respectively, except when there are parallel sessions for the same track. For example, after the coffee break on Tuesday afternoon, there are five oral sessions: Tue-O-I-3a, Tue-O-II-3, Tue-O-III-3, Tue-O-IV-3 and Tue-O-I-3b. Note that Tue-O-I-3b (Track I) is listed after Tue-O-IV-3 (Track IV).

Presentation Guidelines

Oral Sessions:

There are five parallel oral sessions during each period. Each oral paper is allocated 20 minutes, with 15 minutes for presentation and 5 minutes for questions and answers.

Speakers should go to the session room at least 15 minutes before their session starts, introduce themselves to the session chairs and check their presentation material with the computer and audio-visual equipment.

The computer in each session room can display MS PowerPoint and Adobe PDF files. Speakers can bring their presentation material on USB drives. If you use other digital storage devices not supported by the computer in the session room, please ask a conference helper to transfer the files.

Poster Sessions:

Each board is labeled with a Poster ID. Please locate your Poster ID, which is the number before your paper title in this program booklet, for your presentation. The presenters are responsible for setting up and taking down their own posters during the conference.

You are requested to put up your poster 15 minutes before your designated session and then take it down no later than 15 minutes after your session. The conference organizers reserve the right to remove any poster left on the board overtime and will not be held responsible for any loss of or damage to the poster.

Posters must be attached with non-permanent adhesive (such as blue-tac or double-sided tapes). Push-pins, thumb-tacks, or staples are not allowed. The conference organizers will provide such adhesive material in the poster area.
