

IAPR/IEEE WINTER SCHOOL ON BIOMETRICS 2023

8 - 12 January 2023 Shenzhen, China

A Question of Evidence Biometrics and forensics

Mark Nixon

University of Southampton UK

IEEE Biometrics Council Distinguished Lecturer

Where am I?

Southampton

Harbin

Shenzen

The question

You are a **biometrics expert**
... and are contacted by the **police**
... who have a **suspect**.

What do you do?

Identification - history

It's actually quite recent

1858 **Herschel**, palm print on contract (and fingerprint)

1880s **Bertillon**: anthropometry / identification, inc. iris, face, ear

1888 **Galton**: fingerprint

1899 **Henry**: fingerprint classification

1951 **Crick and Watson**: DNA

1964 **Iannarelli**: ear identification

1987 **Flom and Safir**: iris classification

1990 (ish) 'Biometrics'

Police
involvement

What are forensics?

*“scientific tests or techniques used in connection with the detection of **crime**”*

So what is a **crime**?

*“an action or omission which constitutes an offence and is **punishable by law**”*

So **forensics** are

scientific tests used in connection with punishment by law

So in biometrics it's about **producing evidence**

Evidence and admissibility

- Many things are **evidence**, but not all are **admissible**
- Rules and procedures **differ**
- **Daubert** is for expert witnesses

(not much biometrics in forensics, so for a new technique)

1. *Whether the theory and methodology have been tested, **peer-reviewed**, or published:*

write a paper, apply it to something else

2. *The potential and known **error rates** for a particular technique:*

include error bars

3. *Any **standards** and controls applicable to the science.*

4. *The degree of **acceptance** in the scientific community:*

organise special session/ special edition/ competition,
edit book, get on television, podcast, tutorial

Mr. Bean's evidence

No, it's not admissible
It fails Daubert, but it's great!

Judicial systems – presenting the evidence

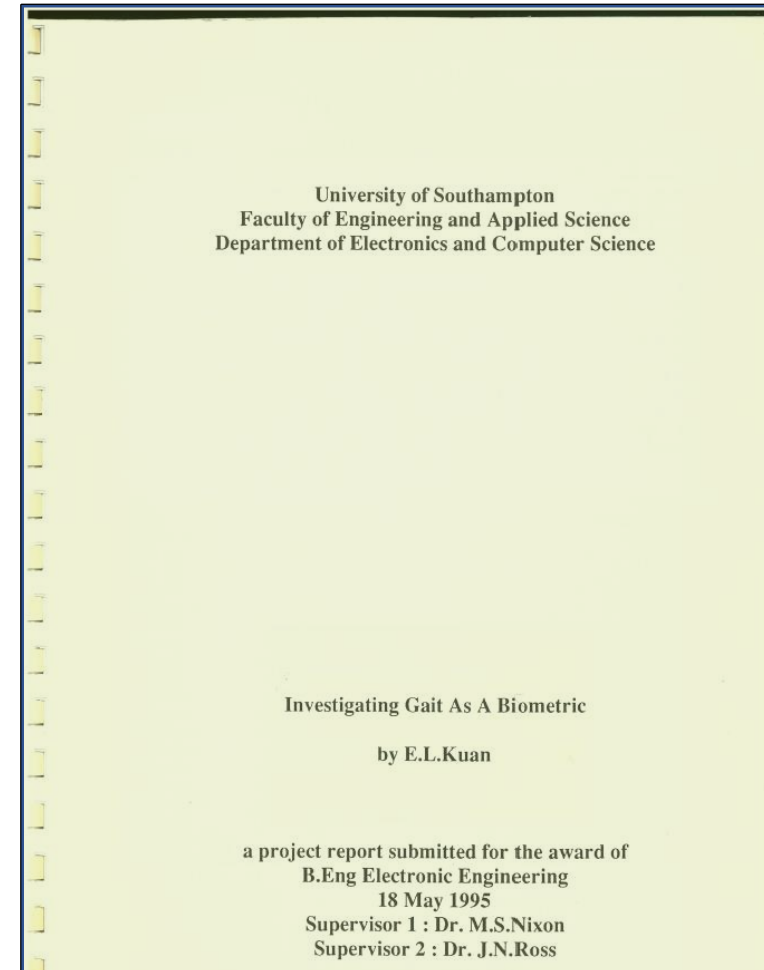

Differing types of system

1. **Adversarial** – convince a jury
 - A. Civic duty
 - B. ‘Random’ composition
2. **Inquisitorial** – convince magistrates/committees
3. **Autocratic** – hmm, better less said!!

You have to convince people who are **not** experts in biometrics

Identifying people by their gait

Gait recognition – the state of art

Technique: mainly deep

Data: Frontal-View Gait (FVG)
CASIA E

Applications: increasing use in crime scene analysis

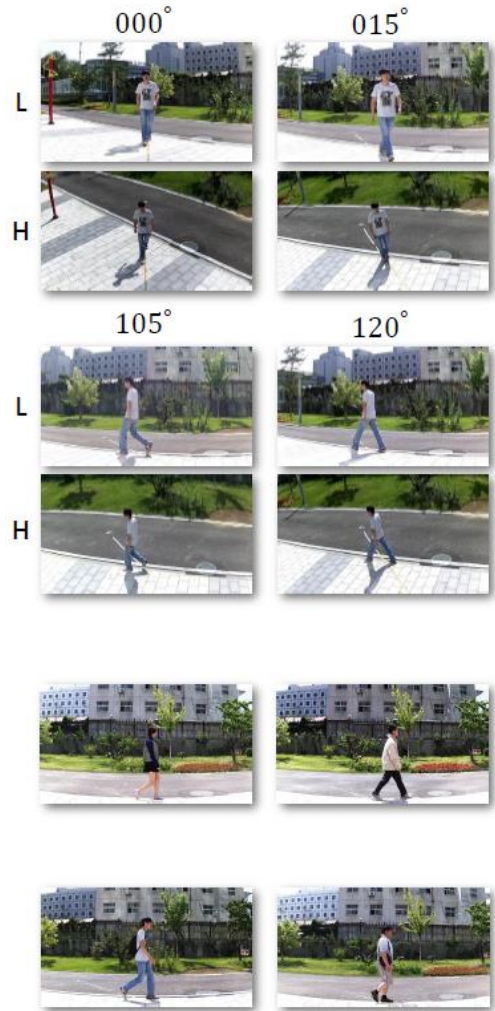

Fig. 1: The number of gait recognition papers published after 2015 using non-deep (orange) and deep (blue) gait recognition methods.

A Sepas-Moghaddam, *Deep Gait Recognition: A Survey, 2022*

LB [46]	18	36	67.5	93	99.5	99.5	92	66	36	18	56.9
L-CRF [12]	38	75	68	93	98	99	93	67	76	39	67.8
GaitNet (ours)	68	74	88	91	99	98	84	75	76	65	81.8

Zhang et al, CVPR 2019

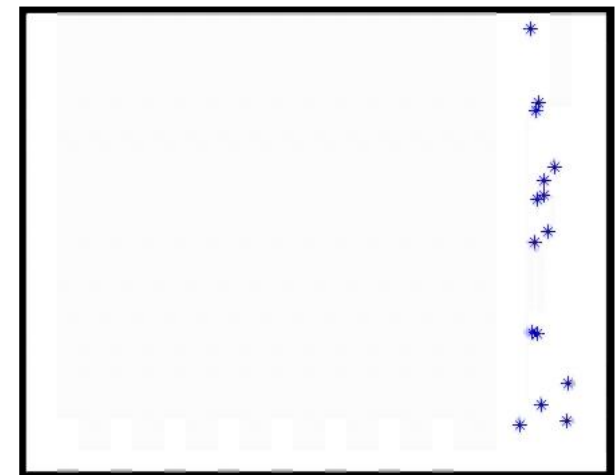

Generally, big(ger) numbers!!

Technology in 1994

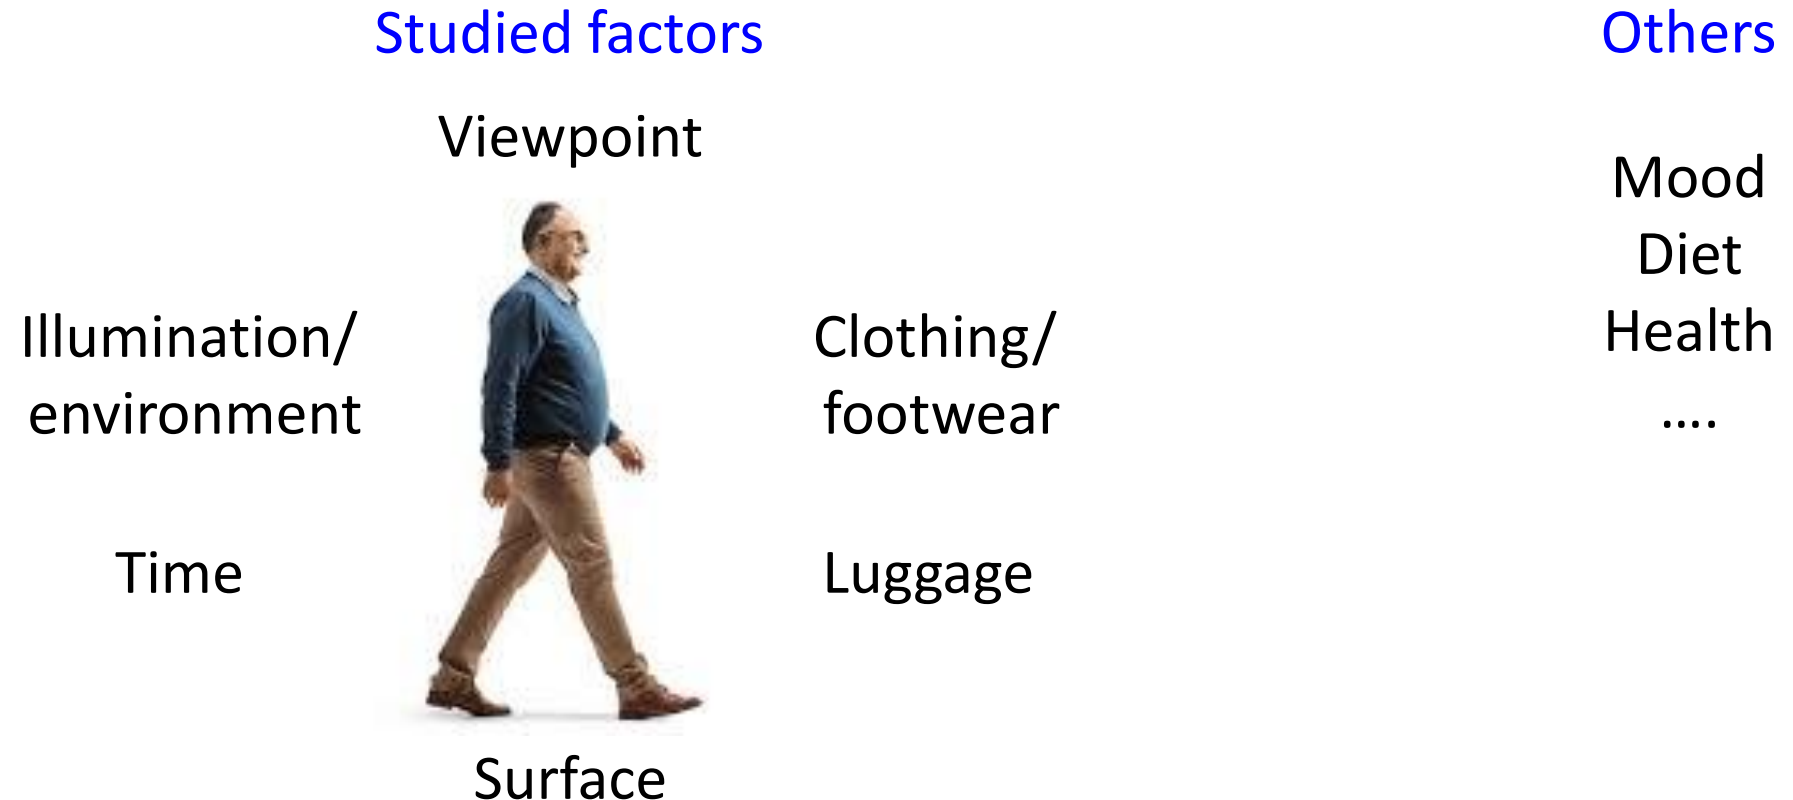

Justifying gait as a biometric

- **Shakespeare** observed recognition:
*“High’st Queen of state; Great Juno comes; I know her by her **gait**”* [The Tempest]
*“For that John Mortimer....in face, in **gait** in speech he doth resemble”* [Henry IV/2]
- **Psychology**
Johansson [73] MLDs recognised as humans
Kozlowski [77] gender and effect of height

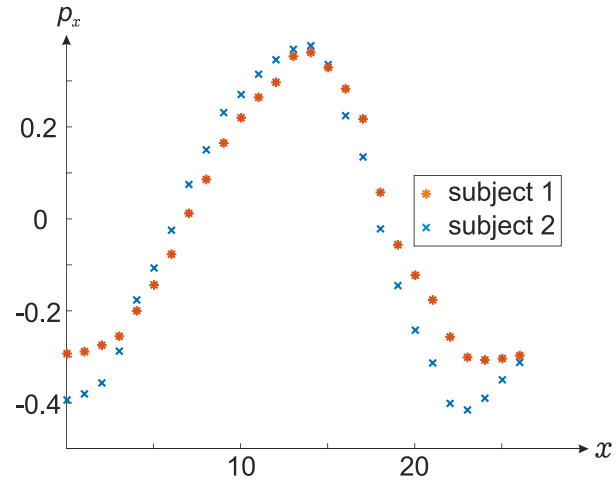

What is the state of knowledge

What affects the **perception of gait**?

Model-based recognition

Inclination of thigh

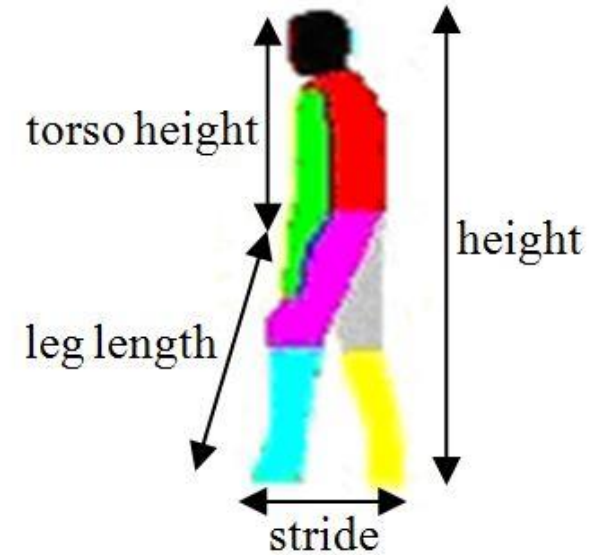

Magnitude of DFT

Difference between
magnitude

Difference between
phase

Other models are
possible

Gait as evidence – first use

Bag snatcher, London 2008

Note controlled trajectory

Using gait as evidence -database

Use multiview gait data

CASIA B at the time

*

with automated labelling

Gait as evidence -approach

Match measure for **subject**, N vertices in W frames

$$d = \sum_{f_1, f_2 \in W | f_1 \neq f_2} \sum_{j, k \in N} \| \mathbf{v}_j(f_1), \mathbf{v}_j(f_2) \| / (N \times W)$$

Analysis from **database**, S subjects

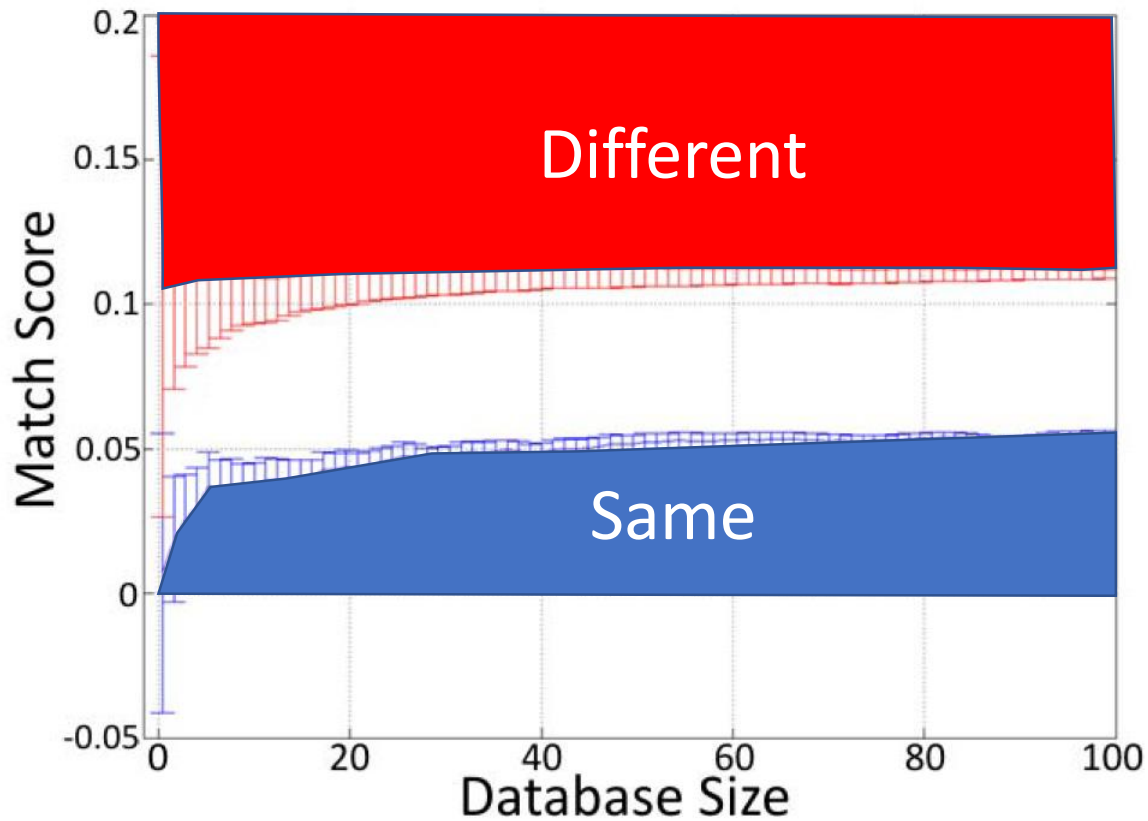

Within class $d_w = \left(\sum_{s \in \text{database}} \sum_{f_1, f_2 \in W | f_1 \neq f_2} \sum_{j, k \in N} \| \mathbf{v}_j(f_1, s), \mathbf{v}_j(f_2, s) \| / (N \times W) \right) / S$

Between class $d_b = \left(\sum_{s_1, s_2 \in \text{database} | s_1 \neq s_2} \sum_{f_1, f_2 \in W | f_1 \neq f_2} \sum_{j, k \in N} \| \mathbf{v}_j(f_1, s_1), \mathbf{v}_j(f_2, s_2) \| / (N \times W) \right) / S$

Confidence = $(\text{mean}(d_b) + \text{mean}(d_w)) / (\text{range}(d_b) + \text{range}(d_w))$

Match success = $d \subset \text{range}(d_i)$

Gait as evidence –analysis on database

Distances

Confidence

Evidence

By computing the match based on the anthropometric distances, the aggregated difference in joints' position is lower than 3%. Currently, we consider that a match lower than 15% suggests a possible and that 3% indicates a very close match.

Accordingly, **I am very confident in my statement that there is a match between the male subject walking in Video A and the subject walking in Video B.**

I can provide the data used in our analysis should it be required. I can also provide images of the two subjects during ingress where the subject's posture and appearance appear to confirm this conclusion.

(Professor M. NIXON)

Likelihood ratio

- Introduces probabilistic reasoning to evidence
- Describes the degree of support of one proposition vs its alternative
- **Prosecution** proposition H_p : accused is **same** as perpetrator
- **Defence** proposition H_d : accused **differs** from perpetrator
- **Likelihood ratio** $LR = \frac{p(E|H_p)}{p(E|H_d)}$ $LR > 1$ supports **prosecution**
 $LR < 1$ supports **defence**
- H_p is intra-class probability density; H_d is inter-class
- Needs **score to LR calculation** (logistic regression, kernel density, GMM)
- Needs **calibration**
- Needs **standards**

Ears by same procedure

Ears are unique and permanent, and rarely hidden (for ID)

Nixon, Bouchrika, Arbab-Zavar,
Carter, *Eusipco* 2010

Ears have many interesting features

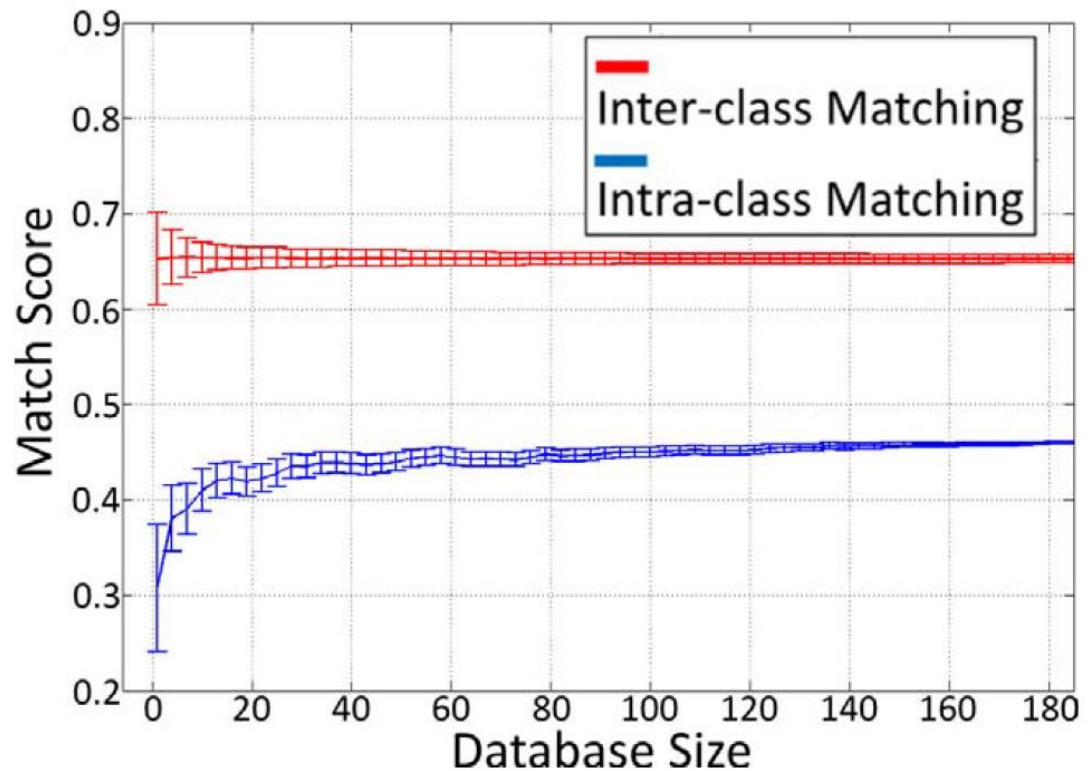

(a) Model parts

(b) Detected parts

Matching on an ear database

Variance is much
smaller

Identity science: where is gender in ears?

male

female

ROI

... and age, kinship, ...

Can you determine gender by ear?

- Man or woman?

Sophia Loren

George Clooney

Emma Watson

... and age, kinship,

Biometrics in the literature 1

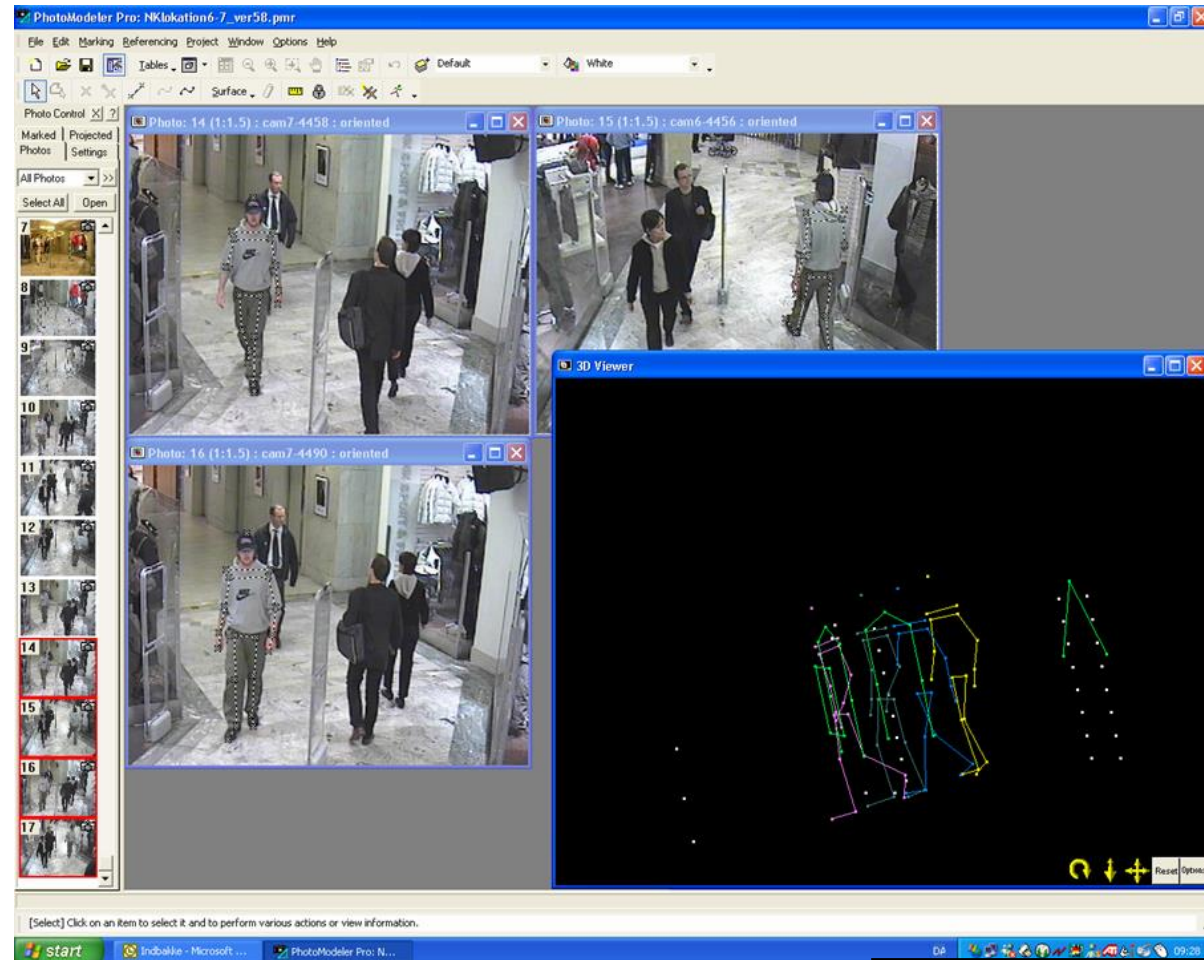

“...biometric systems in forensic science today aim at filtering potential candidates and putting forward candidates for further 1-to-1 verification by a forensic specialist..”

Biometrics in the literature 2

Forensic anthropology

Murder of Swedish
foreign secretary,
Anna Lindh

N. Lynnerup and J. Vedel J.
Forensic Sci., 2005

Biometrics in the literature 3 Forensic podiatry

“Forensic gait analysis, **the direct visual comparison of two or more video recordings** to establish whether they are of the same individual ... based on the gait pattern alone”

- “There is **no published standardised approach** for forensic gait analysis comparison”
- “There appears to be **little consistency** in the formal recording ... for forensic gait analysis”
- “the strength of the conclusion ... is often only a **subjective estimate**”
- “no credible database”, “no published and verified error rates”, “no published black-box studies”

And (!!)

- **automated methods ... differ from forensic gait analysis ...make use of a much richer dataset**

End of forensic podiatry?

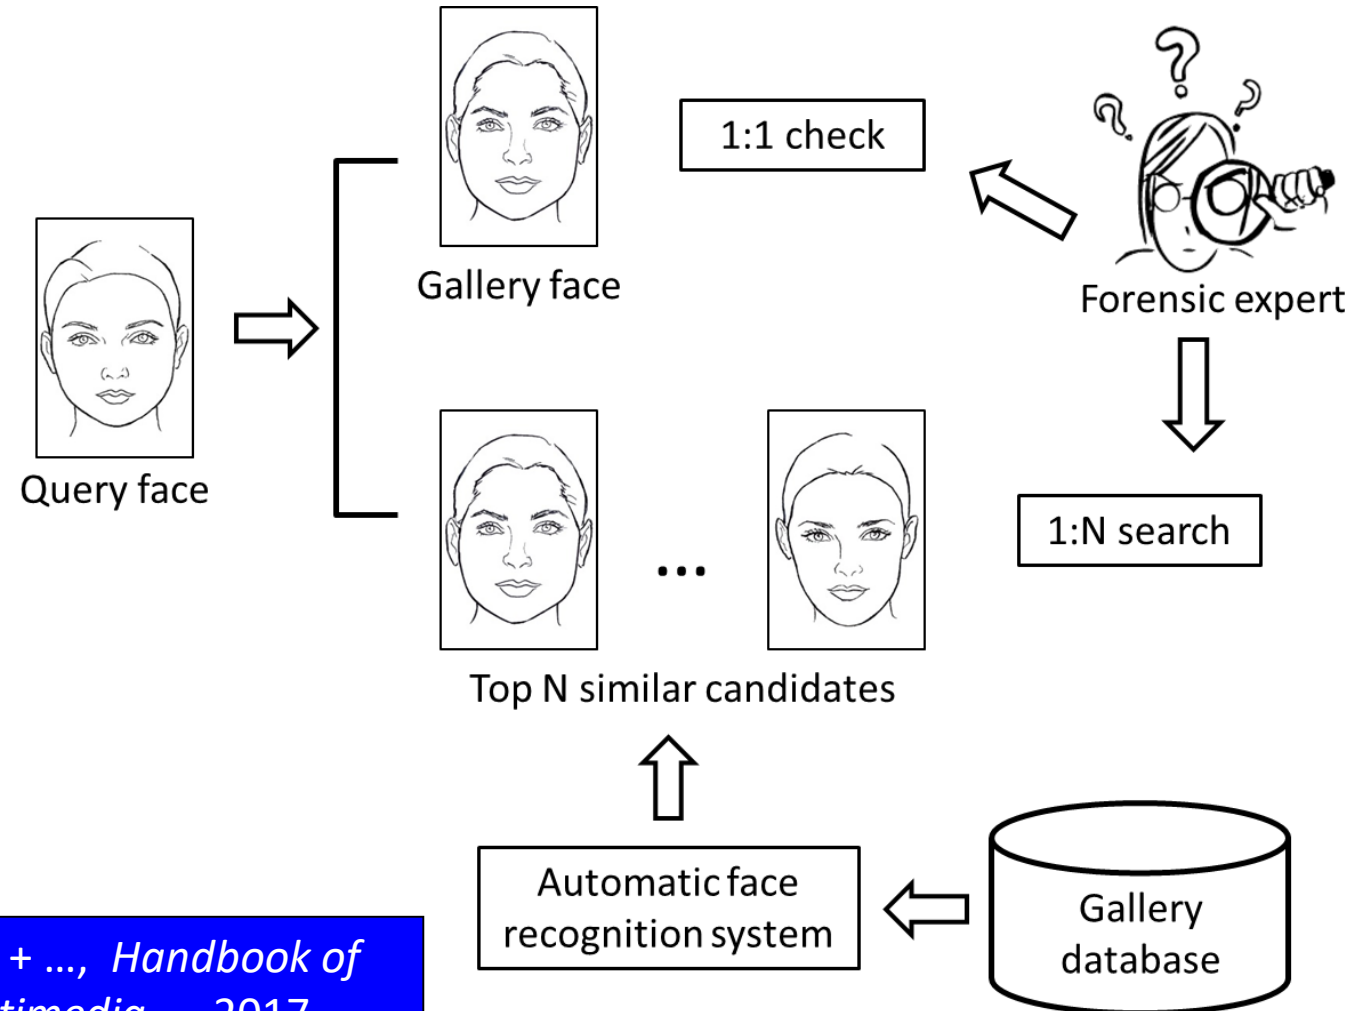

“The methods remain **insufficiently robust**, considering the recent paradigm shift witnessed in the forensic science community regarding quality of evidence.”

“However, there is persistence in attempting to prove that as it stands, **forensic gait analysis should not fall into disrepute** in the forensic science community”

“Automated gait recognition has greatly surpassed forensic gait analysis”

Macoveciuc, Rando +, Forensic gait analysis and recognition: standards of evidence admissibility, *J. Forensic Science*, 2019

Biometrics in the literature 4 - face

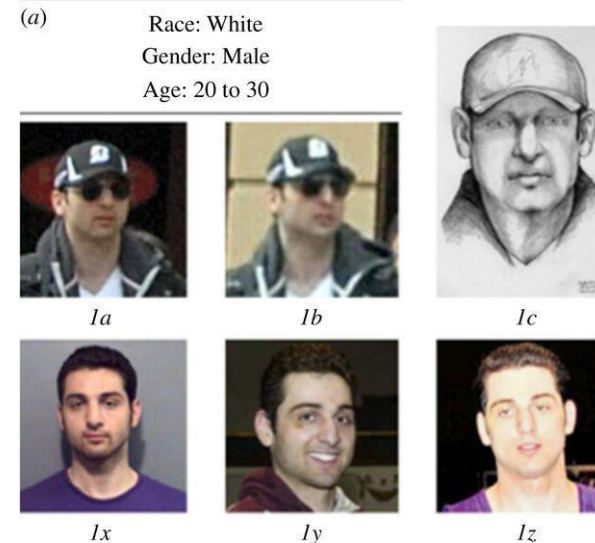

Biometrics in the literature 3 Face recognition

Boston police video:

The public was asked to help identify these two individuals

Jain, Ross, *Transactions of the Royal Society B*, 2015

(b) with demographic filtering (white male, 20–30)

	<i>1a</i>	<i>1b</i>	<i>1c</i>	mean
<i>1x</i>	5432	27 617	112	353
<i>1y</i>	518	25 780	1409	686
<i>1z</i>	3958	14 670	1142	1416
mean	424	5790	71	82

Biometrics:

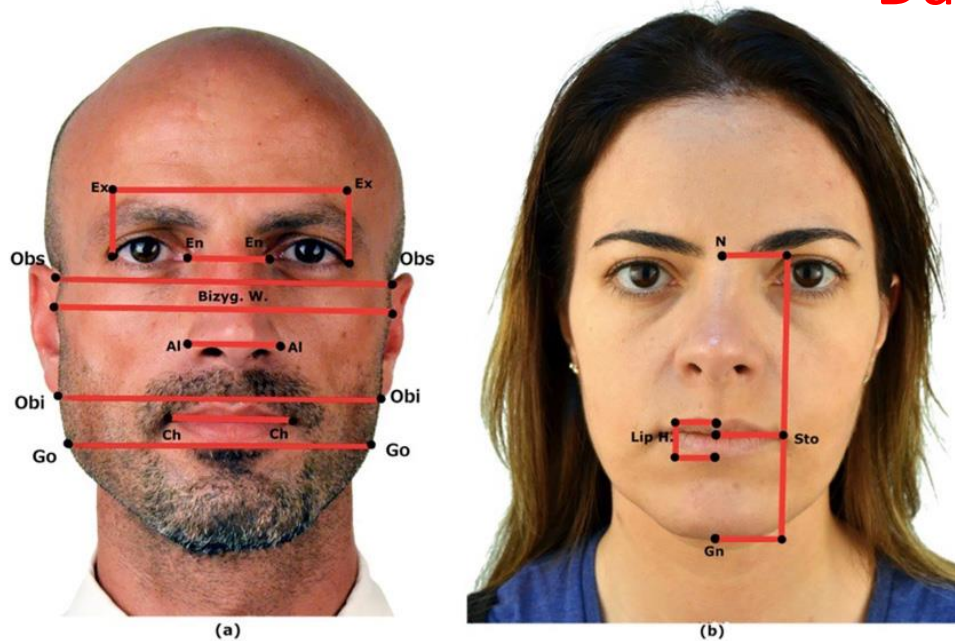

composite-to-photo matching

Composite of Tamerlan Tsarnaev (*1c*) resulted in a better match with the gallery image (*1x*) than any of the probe images (*1a* and *1b*) released by the police

Sex estimation from biometric face photos for forensic purposes

sex estimation could be made with an accuracy of 80.5%

Daubert

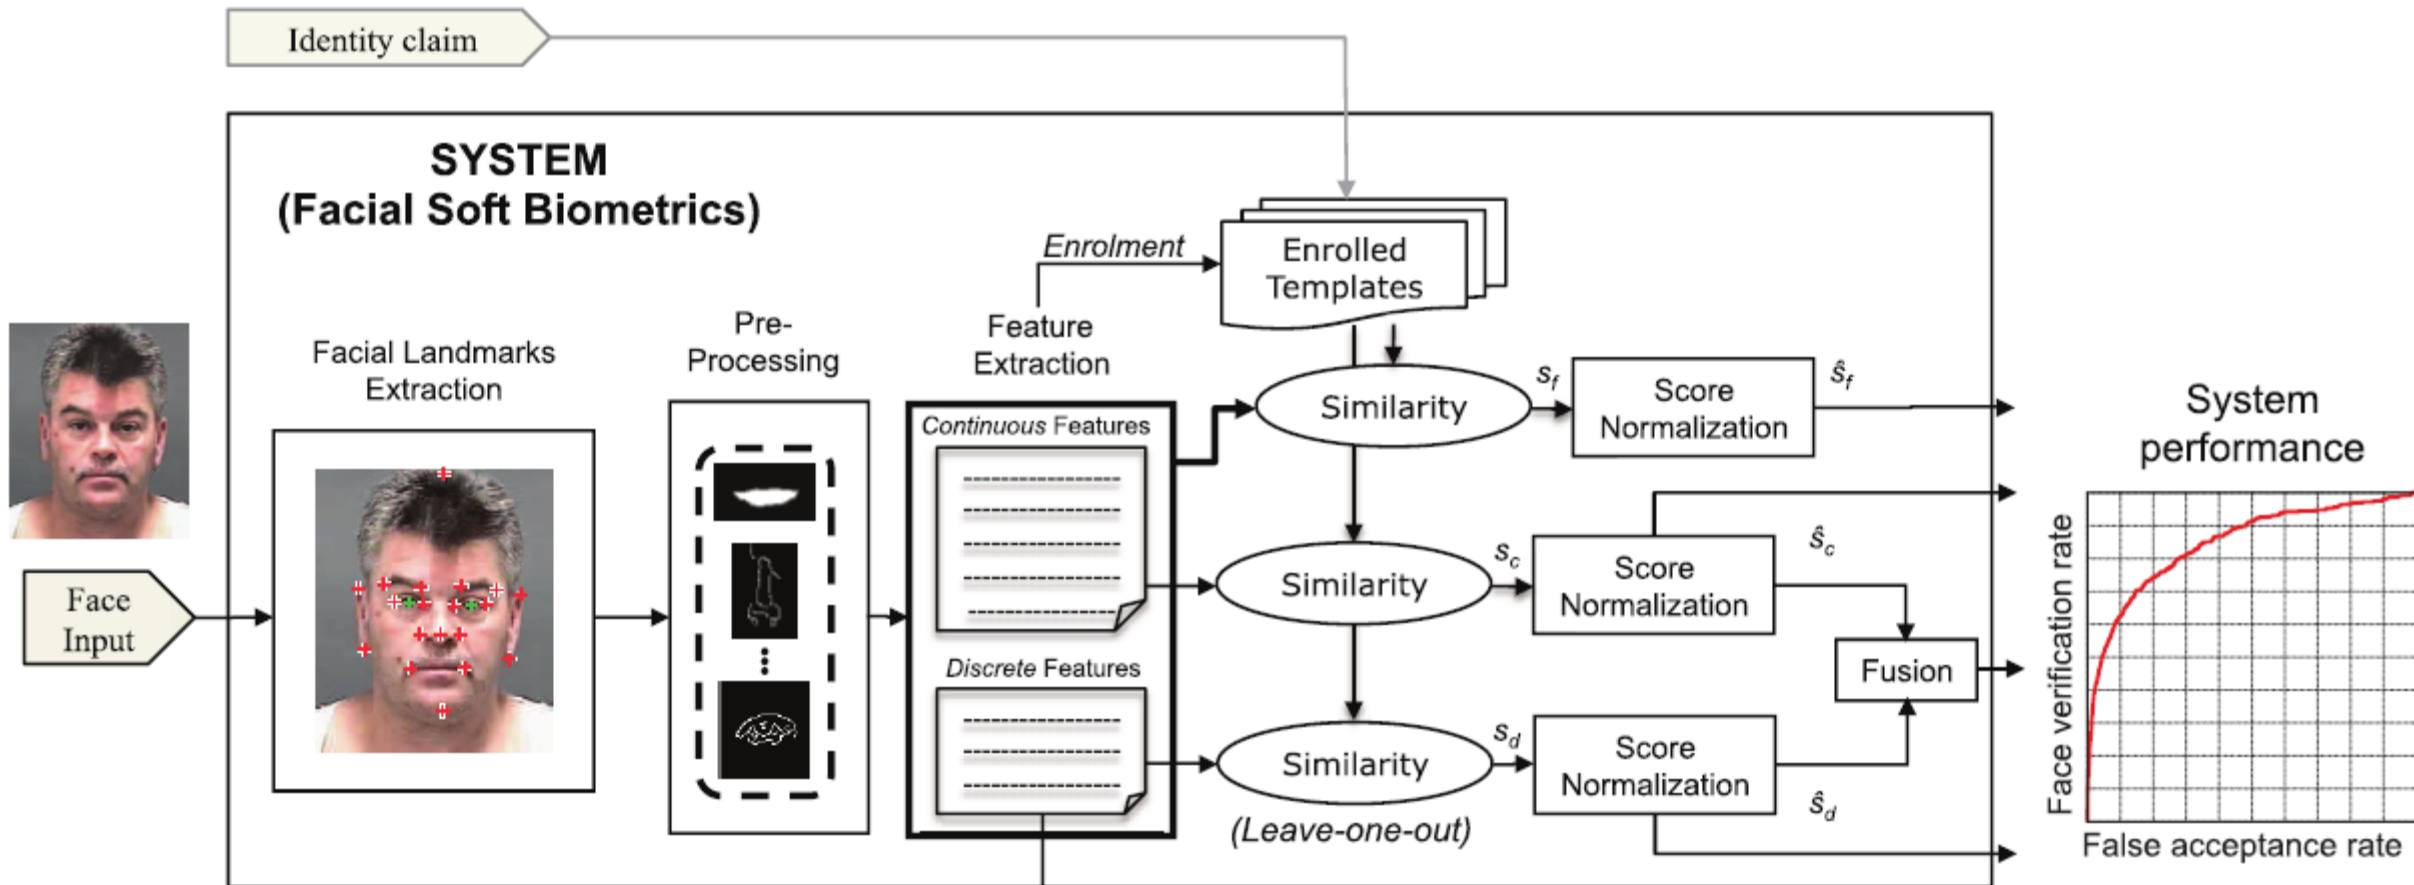

(left), (right) Distances taken between landmarks (Obs: otobasion superior, Obi: otobasion inferior, Go: gonion, bizyg. W.: Bizygomatic width, En: endocanthion, Ex: exocanthion, Al: alare, Ch: chellion, N: nasion, Gn: gnathion, Sto: stomion).

Facial Soft Biometric Features for Forensic Face Recognition

Advantages of biometrics in forensics

1. Large databases – **representative** of large modern populations
(vs databases of criminals; lineups/ identity parades)
2. Large databases – reduce **cognitive bias**
(vs. subjective reality of criminal data)
3. Automated processing
fast and **reproducible** results
chain of **reasoning**
error bars

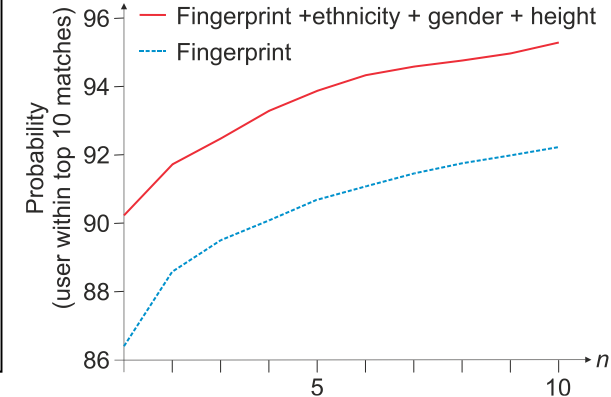

Future work

- Law
- Methodology
- Evidence
- Identity science
- Use human vision?

Descriptions and attributes for identification

Eyewitness statement

“24 year old male average height wearing shirt”

Image of crime

Generate description

Subject	Gender	Age	Height	Nose W	Top
?	M	24	171	2.4	Shirt

Database of images

Generate descriptions

Subject	Gender	Age	Height	Nose W	Top
123456	M	25	172	2.3	Shirt
123457	F	36	156	2.2	Blouse
123458	M	58	182	1.2	T shirt

Database of descriptions

Images: more than meets the eye?

Computer Vision and Human Vision have different abilities

Describing people: traits and terms

Global Features

- Features mentioned most often in witness statements
- Sex and age quite simple
- Ethnicity
 - Notoriously **unstable**
 - There could be anywhere between 3 and 100 ethnic groups
 - 3 “main” **subgroups** plus 2 extra to match UK Police force groupings

So we thought!!

- Global
 - Sex
 - Ethnicity
 - Skin Colour
 - Age
- Body Shape
 - Figure
 - Weight
 - Muscle Build
 - Height
 - Proportions
 - Shoulder Shape
 - Chest Size
 - Hip size
 - Leg/Arm Length
 - Leg/Arm Thickness
- Head
 - Hair Colour
 - Hair Length
 - Facial Hair Colour/Length
 - Neck Length/Thickness

Human descriptions: recognition capability

First result

Problems with absolute/ categorical descriptors

Subjective = **unreliable**; Categorical = lacks **detail**

Comparative human descriptions

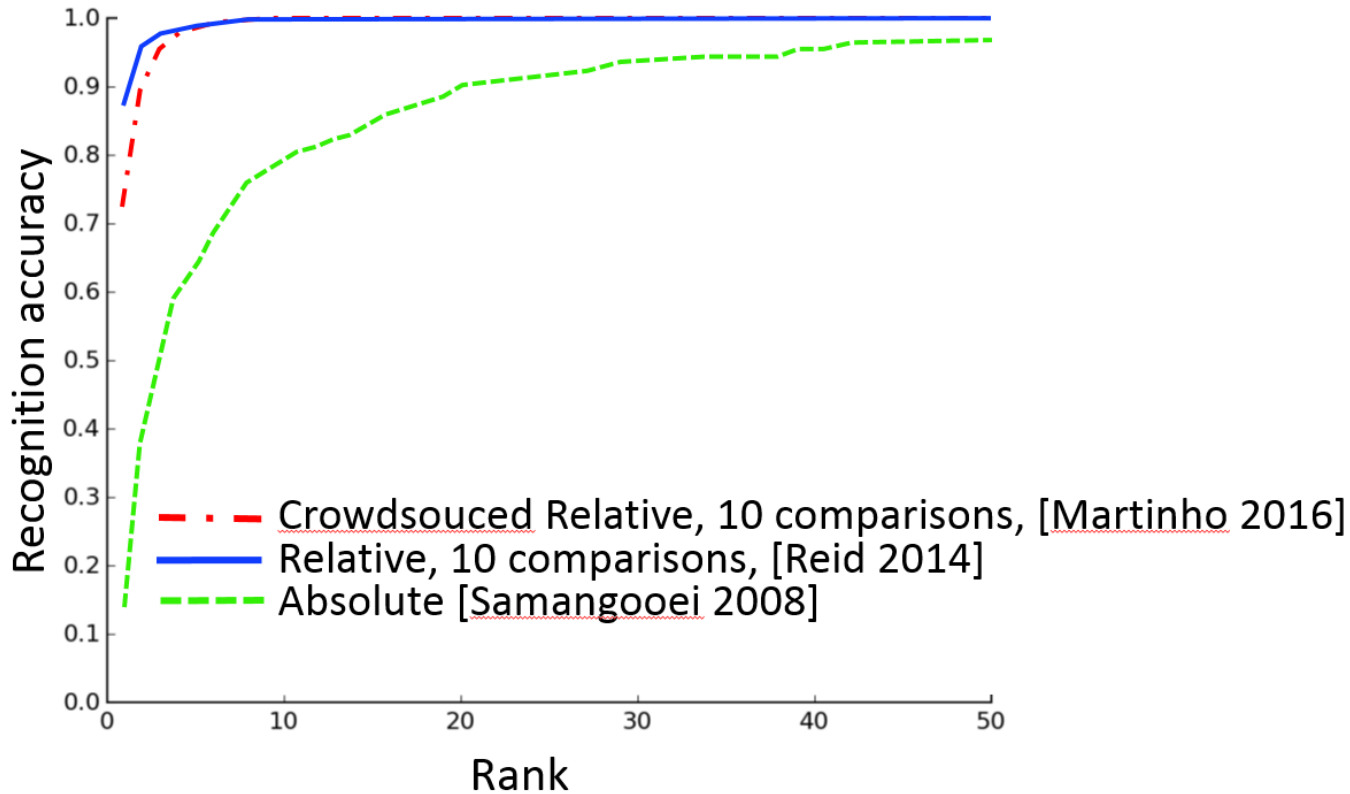

- **Compare** one subject's attribute with another's
- **Infer** continuous **relative** measurements

Please compare the subject in the lower video to the subject in the top video.
For example if the subject in the bottom video is taller than the subject

Attribute	Annotation
Age	Older
Bottom subject is OLDER than the top	
Hair Colour	Same
Subjects have roughly the SAME hair colour	
Hair Length	Longer
Bottom subject has LONGER hair than the top	
Height	Taller
Bottom subject is TALLER than the top	
Figure	Same
Subjects both have roughly the SAME figure	
Neck Length	Same
Subjects have roughly the SAME length neck	
Neck Thickness	Thinner
Bottom subject has a THINNER neck than the top	
Shoulder Shape	Same
Subjects have roughly the SAME shoulder shape	
Chest	Same
Subjects have roughly the SAME size chest	
Arm Length	Longer
Bottom subject has a LONGER arms than the top	

Recognition by crowdsourced body labels

Higher recognition accuracy via comparative
 Lower recognition accuracy via crowdsourcing (expected)
 More labels and comparisons increase accuracy (expected)

Analysing gender on PETA

Group 0 - "male"

54 subjects
6.8% uncertainty
(98.1% labelled male)

Group 1 - "female"

27 subjects
6.8% uncertainty
(0.0% labelled male)

Group 2 - "possibly male"

6 subjects
25.8% uncertainty
(66.7% labelled male)

Group 3 - "neutral"

1 subject
3.2% uncertainty
(0.0% labelled male)

Overall

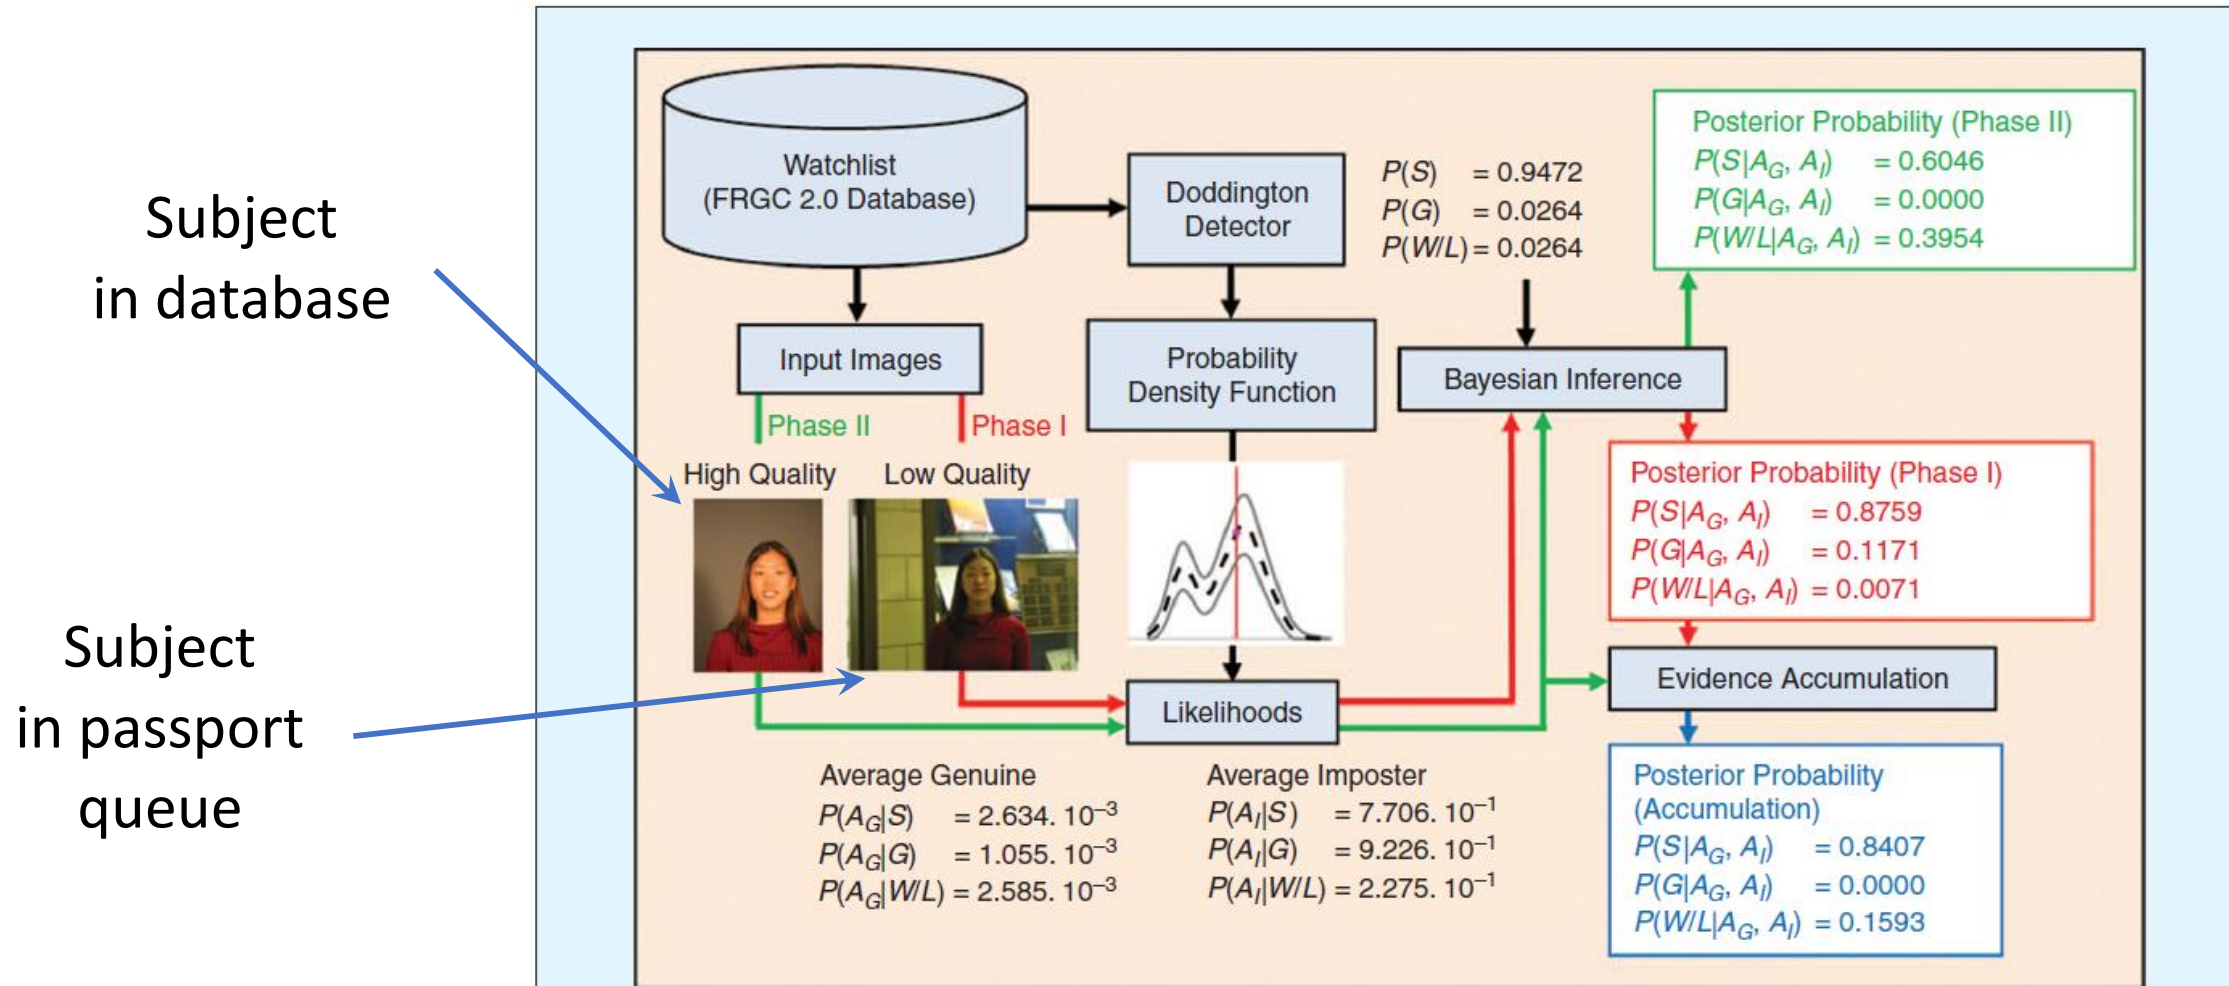

95 subjects
9.7% uncertainty
(61.1% labelled male)

Group 4 - "possibly female"

7 subjects
31.5% uncertainty
(14.3% labelled male)

Biometrics in watchlists

Approaches to recognition

Handcrafted

processing

Deep learning

processing

If deep learning learns it

Clearly, the performance is **fantastic**, and we can do **new** things

.... do we need to know **what** it learns?

..... is **colour** any use (or does it just look good) ?

..... what about **causality** ?

..... where is it **going**?

Problems

There are many **advantages** to using biometrics in forensics...

But the coverage/ usage is **lower**

We need:

1. To **engage** the constituents
2. Prepare **appropriate modes** of evidence
3. **Justify** our technology in means other than usual in our science

Suggestions for generating biometric evidence

1. Write a **paper**, apply it to something else
2. Include **error bars**
3. Generate **likelihood ratio**
4. Use biometric **standards**
5. Organise workshop/ **special session**/ tutorial/ special edition/ competition
6. Edit book, write **news article**/ get on television
7. Get advice on writing **statement**

Conclusions

- In biometrics, forensics is the production of evidence
- Biometrics have many advantages
 1. Automation
 2. Size of data and repeatability
 3. Scientific justification
- We followed the suggestions given here
- Likelihood ratio is a strong contender

There is a need to engage more with justice both in the production and in the dissemination of evidence
